Mexia Will Be Handled Conservatively

Inservatively

Julius Fobs and Judge Means and in Tulsa yesterday from the case of in Tulsa yesterday from the case of insert have been cut down in the formation by agreement, to a minimal for Fohs makes a very intermentation at the magnetic lower. The Magnetia-Dosenberg well, while was purchased by the former pather with 48 agrees of land for axis of the anticline, and is conceed a very good purchase, because of the fact that it is making

a very good purchase, beof the fact that it is making
harrels and every acre will be
for big wells. The Bass well
sidered about equally as good."
Humphreys Mexia company

senciates have the most elab equipment in the way of of boarding houses and ware together with a recreate for the public and have nin the Navasota river damine different places, which af em unlimited water supply ve wells are on top of the ne being drilled in at this

The veils are on top of the wils are reported to have the Humphreys and about 12 other top the state of the veils building and about 12 other wilding for offsets agreed upon a not included in the above, nine decling wells, which would probably have a potential capacity of the building wells, which would probably have a potential capacity of the building of the sand at this me, a production of over \$0.000 trees if drilled in; two drilling is and drilling in the Prather, the oliman the Early and arranging dril the A. E. Berthelson No. 2 ages No. 2 and the Brodmax No. 2 for as outside wells are concerned there are about 30 derivate up for offsets to the Humphrys properties and about 12 additional cations agreed upon for offsets. The wells that are drilling on a Jackson Brothers and Trettereds are reported to have the chalk the will be that are drilling on the properties and about 12 additional cations agreed upon for offsets. The wells that are drilling on a Jackson Brothers and Trettereds are reported to have the chalk that are drilling on the server of the axis the main anticline and possibly present new structural features. The oil from the several wells of a field does not vary either from the top or lower pay not does it

The oil from the several wells of theid does not vary either from top or lower pay not does it y among different wells more p one-half degree from 36 to 37 ross. Recent thorough tests degrees. Recent thorough tests where the cracking process was used show that the yield, after removal of one per cent asphalt and the cracking of the remainder would show about 65 per cent or more commercial gasoline. By removing 20 per cent lubricating stock, 10 per cent cylinder stock and four per cent wax, and cracking the residue, the yield will be close to 50 per cent gasoline.

cent gaseline."

The Magnelia company is proceeding to build tanks on its two tank farms, one at Mexia and the other at Groesbeck as a preliminary stop to joining with its main line and is laying a gathering line from the Desemberg well.

The Humphress company is laying three and one-half miles of gathering line to its tank from the vicinity of the Desemberg well and is building six additional \$5.090-barred tanks, thus being its first sten towards its pipeline to the Gulf where it plans to build a refinery at an early date.

company located in the center of the southeast of the mortheast of 20-15-12 is now drilling at 1,800 feet, and it is expected to pick up a gas sand about next Saturday. The No. I well of Sheridan Oil company in section 5-14-12 is dry and abandoned at a total depth of 2,800 feet. The same company is building a rig located in the northeast corner of the northwest of the northeast of 19-15-12. Mid-Co Getting Deepest

Well in Oklahoma

Well in Oklahoma

Belivers in the deep sand possibilities of the state of Oklahoma are today saying. I teld you so," and from all appearances they have ample justification, in their enthusiasm. The oil field history of the state has been made by these same individuals, and it is traceable throughout the whole development of the game from the shallow fields at Newata, where the oil was found at about 300 feet, down to the present time, where where the deepest producing sand is the 3,900-foot Kay county production of Mariand, that the extension of the fields and the building up of the state has been accomplished by just putting the bit a fittle deeper and discovering a new sand. Any figures on the recoverable oil in the state of Oklahoma are apt to be way off, because it is entirely problematical how many more deep sands exist, even in the oid producing districts, and how many more new pools and how much new produciting.

The latest development along this line is the discovery of a pro-

The latest development along

er drilling.

The latest development along this line is the discovery of a producing sand of untold possibilities by the Mid-Co Petroleum company at a total depth of 4,167 feet on their lease in Garber county. This sand was picked up yesterday in their No. 11A Washburn located in the southeast corner of the northeast of the southeast of 15-23-2w, and at six feet in the well had 3,200 feet of oil in the hole and is estimated to be good for 300 barrels. It is no doubt the despest producing well in the state of Oklahoma, and one of the despest in the Mid-Continent field. This test is located in the renter of the oil fallings pool, which has been famous on account of the numerous avoducing sands, found from 1,200 to 2,700 feet. All of the oil found in this locality has been of unusually high gravity, and it is reported that the crude taken from the Mid-Co well tests from 4t to 46 gravity. The owners of the new producer think the pay is the Evilie sand, found from Bartleaville on west in the Osage as far as Range 8. This sand has always been very prolific and long-lived producing stratas in Oklahoma, and has been found at varying depths, always showing a normal dip of 30 feet to the mile going west. Old-timet's in the Osage country have contended that the Bville merged with other producing sands and played out at Range 8e, and the contended that the Bville merged with other producing sands and played out at Range Se, and the claims of some operators that the Burbank 2,300-foot sand found at Range Se was the B'ville has caused considerable controversy. No proofs have been shown that the Bville existed in the Garher district, and this will lend much more importance to the completion of the Mid-Co test.

the north line of the southwest the southeast of 13-15-11 has on drilled two feet in the Tancha nd topped at 2.152 feet, and is owing for a 400-barrel well, usage is being erected, and this gration will be put on down, into a sand at once.

case is being erected, and this corration will be put on down, into a sand at once. The new producer is the third il completed in this Tancha sand col, and is an eighth of a mile of the original well. The pool is the dilled by the Atlantic Petrologue company, however the late of company, however the late of production increases the prospects of good wells to the east and utheast.

The No. 2 well of Pige and there cated in the northeast corner of the northeast of 21-15-11 is now alking 1200 barrels per day. The possible of two light shots in the provent district abut we countered the production in this operation is a production in this operation. The Lyons-Indiahona companies of the southwest of the northwest of the same section, and the provent district shut was a rig up for a well in the southwest of the northwest of 25.
